

Computer Security Principles – Lab #4

Mohammed Alom – R00144214

Task 1.1

Task 1.2 has been encrypted using the Caesar cipher with a shift value of 9. Decrypt the cipher-text and replace it with the plain-text to continue the lab.

Task 1.2

Cqn cngc oaxv yjac 2 (MX WXC MNLHYC CQN CJBTB) xo cqr b uj k qjb knnw nwl ahycnm dbrwp cqn Ljnbja lryqna fr cq jw dwtwxfw bqroc ejudn. Mnl ahyc cqn lryqna-cngc jwm anyujln rc fr cq cqn yujrw-cngc cx lxwcrwdn cqn uj k. Yunjbn wxcn cqjc cqn oxavjccrwp fruu kn xoo, lxaanlc rc jb hxd bnn orc.

Answer –1.2

The text from part 2 (DO NOT DECRYPT THE TASKS) of this lab has been encrypted using the Caesar cipher with an unknown shift value. Decrypt the cipher-text and replace it with the plain-text to continue the lab. Please note that the formatting will be off, correct it as you see fit.

The screenshot shows a web-based 'Caesar Cipher Decoder' interface. On the left, under 'Results', it states: 'Caesar Cipher (shift: 9). The text from part 2 (DO NOT DECRYPT THE TASKS) of this lab has been encrypted using the Caesar cipher with an unknown shift value. Decrypt the cipher-text and replace it with the plain-text to continue the lab. Please note that the formatting will be off, correct it as you see fit.' On the right, the 'Caesar Cipher Decoder' section shows the input '★ CAESAR SHIFTED CIPHERTEXT' as 'Cqn cngc oaxv yjac 2 (MX WXC MNLHYC CQN CJBTB) xo cqr b uj k qjb knnw nwl ahycnm dbrwp cqn Ljnbja lryqna fr cq jw dwtwxfw bqroc ejudn. Mnl ahyc cqn lryqna-cngc jwm anyujln rc fr cq cqn yujrw-cngc cx lxwcrwdn cqn uj k. Yunjbn wxcn cqjc cqn oxavjccrwp fruu kn xoo, lxaanlc rc jb hxd bnn orc.' Below the text, there is a radio button selected for 'KNOWING THE SHIFT:' and a text input field containing the number '9'.

Part 2 – Substitution and Frequency Analysis

When a shift value is used, the cipher alphabet is automatically generated, as seen with the Caesar cipher. This means that the key is just a number, making remembering the key and passing the key around quite easy. However, this also means that it can be quite easy to retrieve the plain-text by simply guessing the key. An arbitrary cipher alphabet (also known as a substitution alphabet) could be defined instead, with each plain-text letter then being substituted by the corresponding cipher-text letter. Example: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z C T K J F Z Y G O S L V A Q X B E N R M H I D T P W With the above arbitrary cipher alphabet mapped to the plain-text alphabet Bob can encrypt the message

“COMPUTER SECURITY” as “KXABHMFN RFKHNOMP”. Alice would have to know what the substitution alphabet is in order to decrypt the message. This essentially makes the substitution alphabet the key. Applying brute force against this could eventually return the correct plain-text. However this would require testing all possible combinations of the substitution alphabet of which there are $4.032914611 \times 10^{26}$ possible combinations, assuming that only the 26 letter English alphabet is used. A smarter way to do this would be to apply statistical analysis to the cipher-text, specifically frequency analysis. Frequency analysis is the idea of documenting the frequency of letters, letter pairs, letter groups, numbers, and symbols in the cipher-text, and using this information to derive the plain-text. This is made possible because of language characteristics, word structure, and sentence structure. In an arbitrary sentence, letters will appear with varying frequencies. By documenting these frequencies and cross-referencing them with the general letter frequencies in a language, the plain-text can be deciphered. The longer the cipher-text the more successful this analysis should be. In the English Language, the following is the order of the most commonly used letters, going from left to right with “e” as the most common and “z” as the least common: e t a o i n s r h l d c u m f p g w y b v k x j q z This frequency can actually change depending on the context of the document analysed. <http://letterfrequency.org/> has a list of the varying frequencies. The most common double letter frequencies are: ss ee tt ff ll mm oo Common sense is also a valuable tool when used alongside frequency analysis. For example, after discovering that the first 3 letters of a 4 letter word are “thi-”, it could be guessed that the 4th letter is “s” making the word “this”. Similarly, if cipher-text was to start “SDPOP VOP” then it would be possible to guess that the plain-text may be “THERE ARE”. We can therefore make the assumption that T is S, D is H, E is P, and so on. Taking these assumptions and applying the relevant substitutions to the rest of the cipher-text will quickly show whether or not the assumption was correct. By pairing the known frequencies with common sense, it becomes possible to crack weak substitution ciphers. You’ll need to decrypt Task 2.1 the same way this text was decrypted. Tools The following site has a tool which can be used to encrypt and decrypt and substitution cipher and perform frequency analysis and automatically crack a cipher: Cipher: <http://www.dcode.fr/monoalphabetic-substitution> Frequency Analysis: <http://www.dcode.fr/frequency-analysis>

Task 2.1

Task 2.2 has been encrypted using a substitution cipher. The key is “VUTWZHLISKDYMBQIXFCGJERNOAP”. Decrypt the cipher-text and replace it with the plain-text to continue the lab.

Task 2.2

TASK 2.3 HAS BEEN ENCRYPTED WITH A SUBSTITUTION CIPHER. THE KEY IS NOT KNOWN. DECRYPT THE CIPHER-TEXT MANUALLY WITH THE AID OF FREQUENCY ANALYSIS AND REPLACE IT WITH THE PLAIN-TEXT TO CONTINUE THE LAB. YOU WILL NEED TO USE THE MANUAL DECRYPTION METHOD ON THE TOOL PROVIDED IN THE ABOVE LINK. HINT: THERE IS A

URL IN THE TEXT WHICH POINTS TO THE SAME SITE IN THE ABOVE LINKS.
THERE IS ALSO CIPHER-TEXT BETWEEN QUOTATIONS.

Part 3: Public key cryptography.

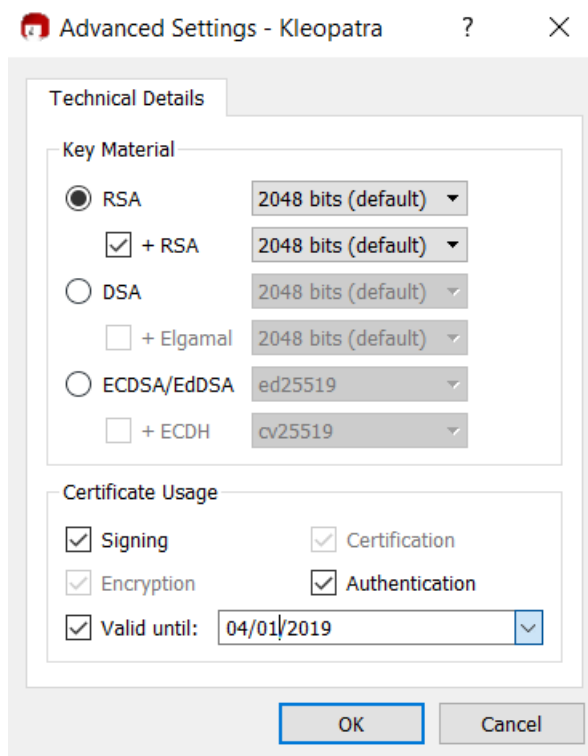

Task 3.1 Generating a public/private key pair

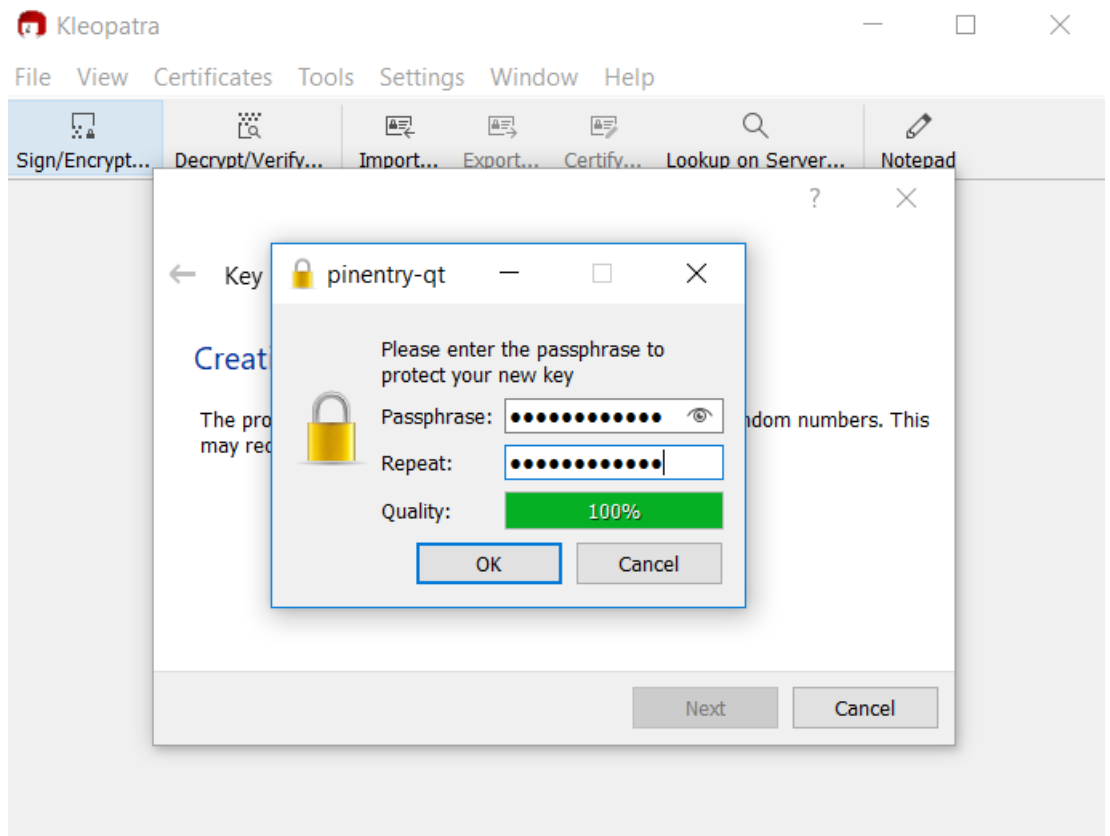

Entering Name and Password

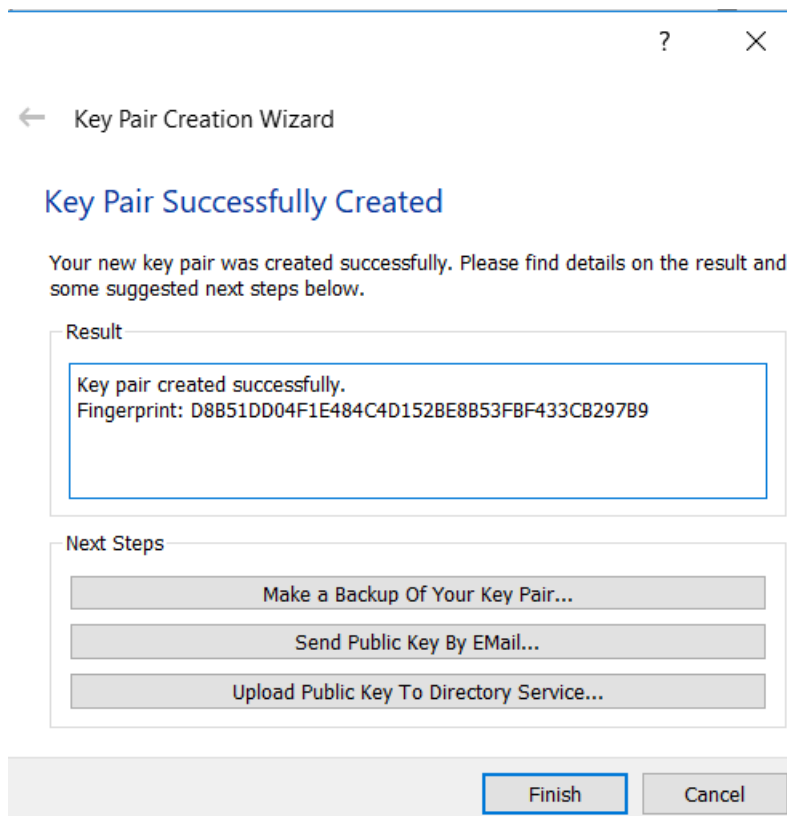

Advance Setting

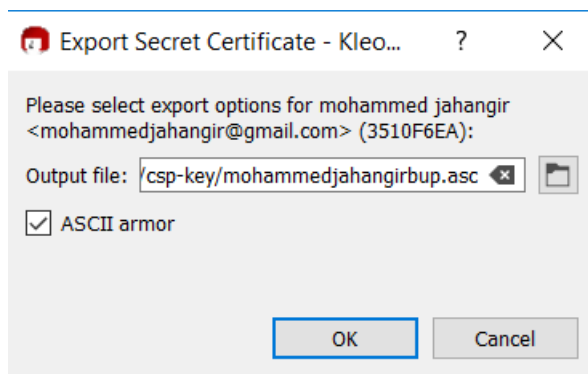

Setting the passphrase

Key is created and its screenshot

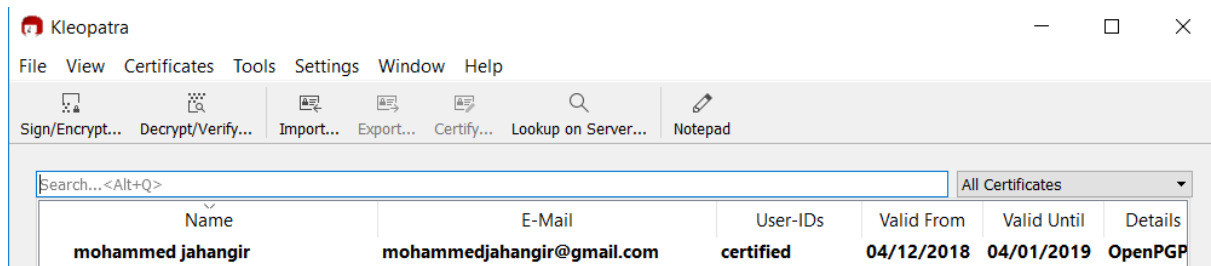

Saving Backup the key

Exported secret key

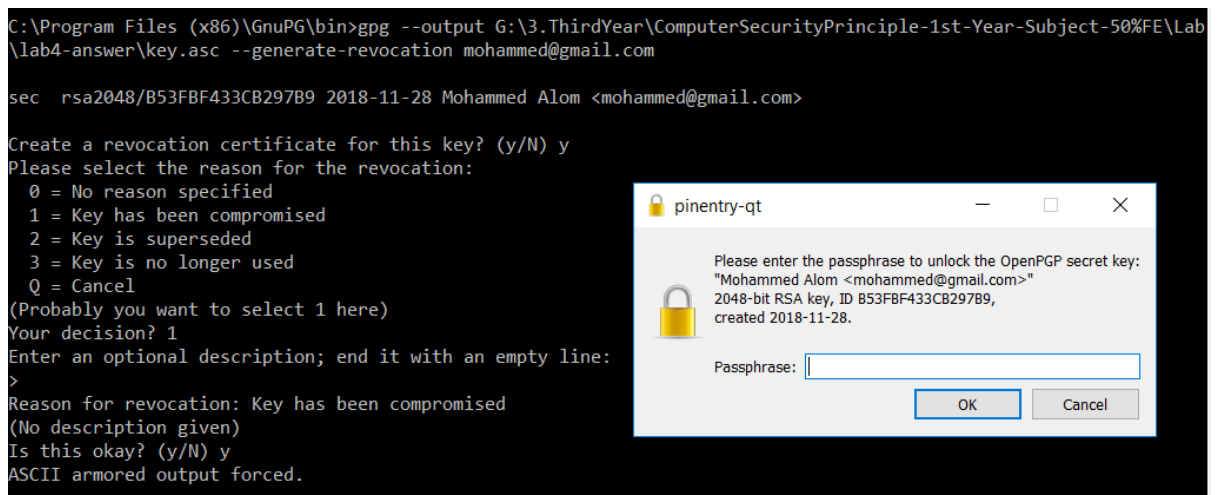

Key is visible now

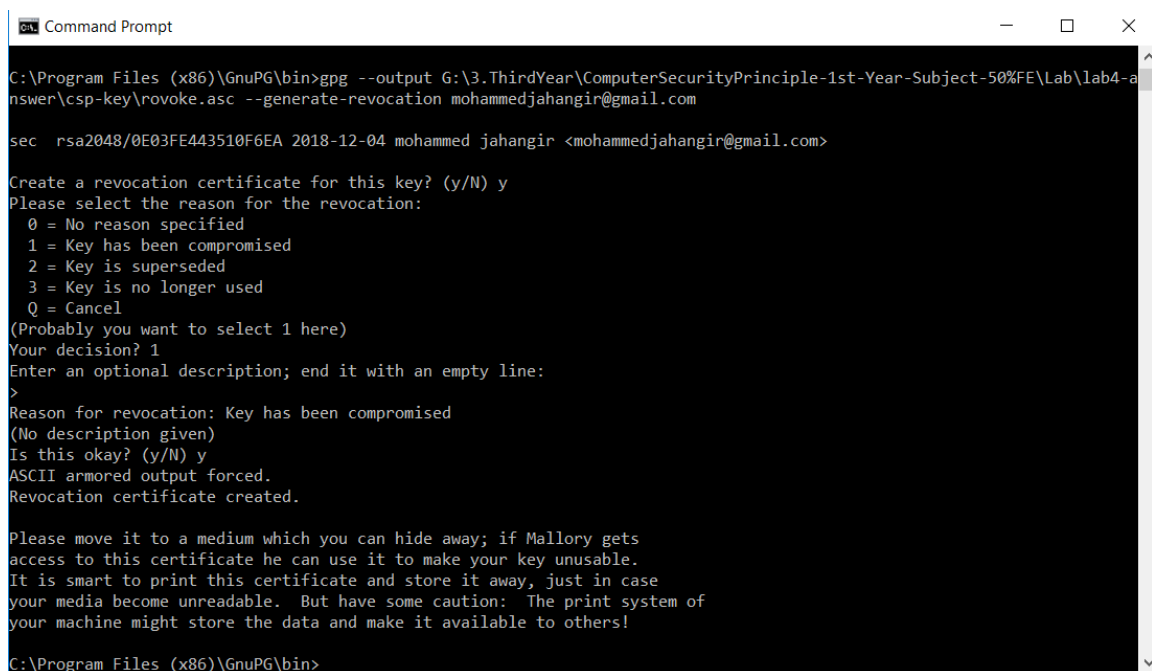

Task 3.2 Generating a revocation key in case of private-key theft

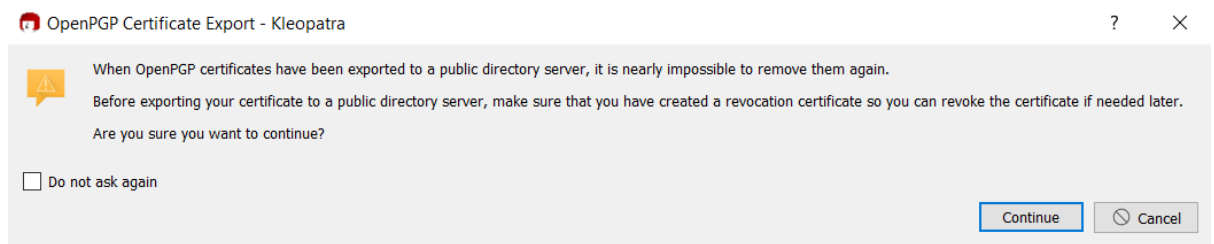

Generating the key

Storing the key..

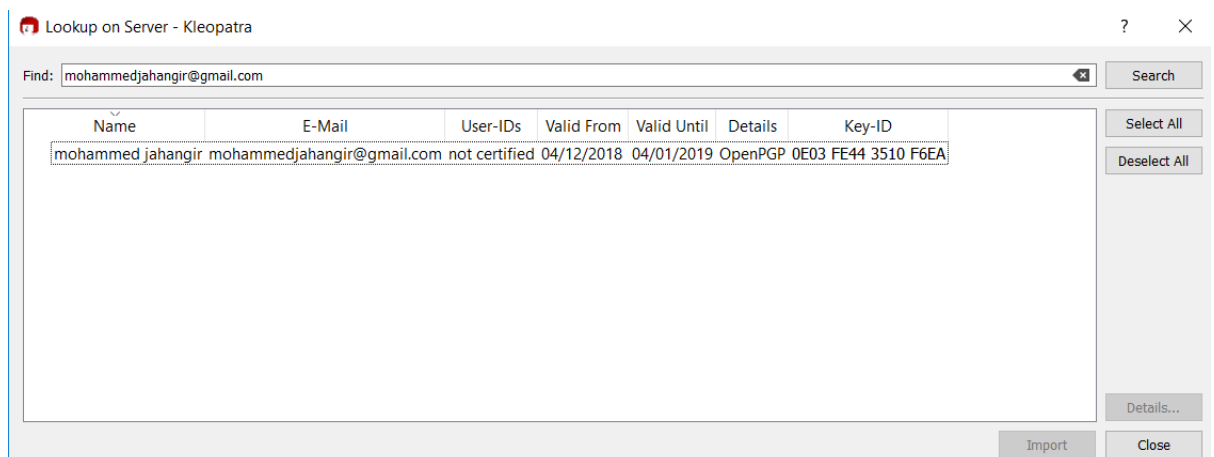

Task 3.3 Exporting the key to the key-server

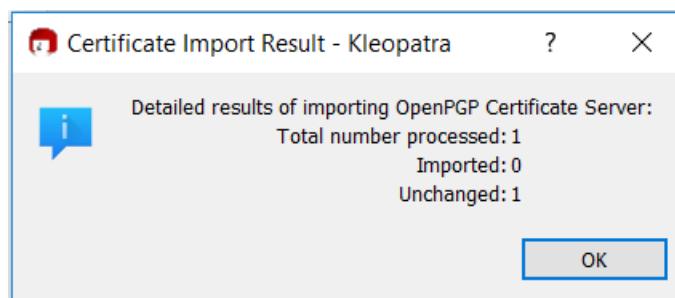

Publish to the server successfully

Account is showing in the server

Imported the public key

Looking the person on the server

Lookup on Server - Kleopatra

Results

Status and progress of the crypto operations is shown here.

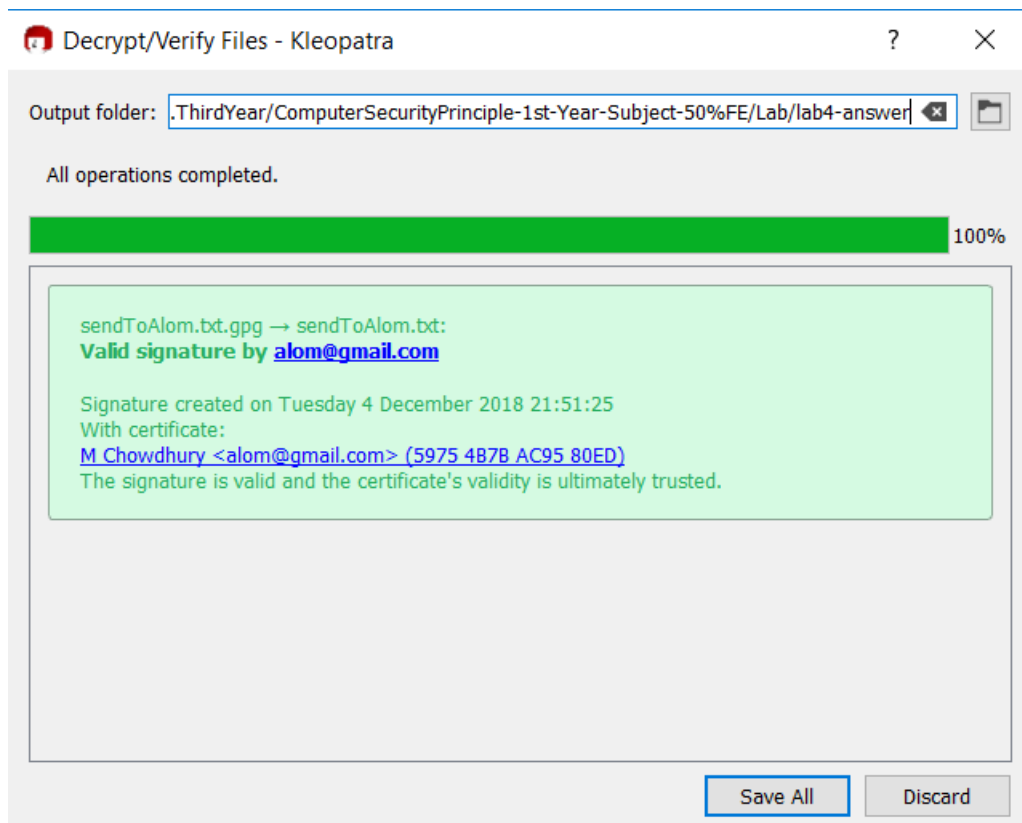

OpenPGP: All operations completed.

sendToAlom.txt → sendToAlom.txt.gpg: **Signing and encryption succeeded.**

Finish

Cancel

Task 3.8 Verifying a message

Task 3.9 Communicating securely with your lab partner.

There was no lab partner was available that time to check that functionality.

Part 4 Verify Software using a Detached Signature File

Downloading the Putty 32 bit version putty.exe and signature file

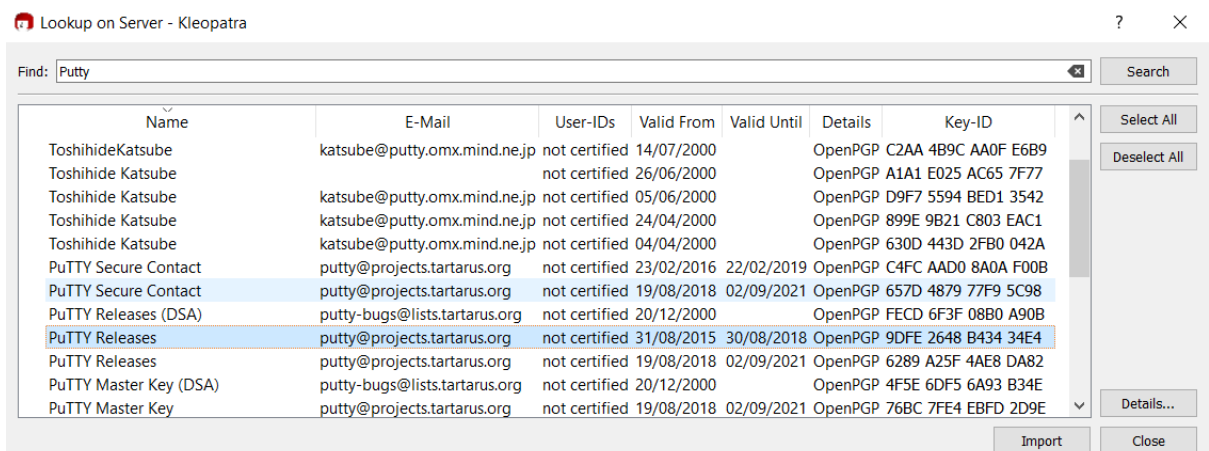

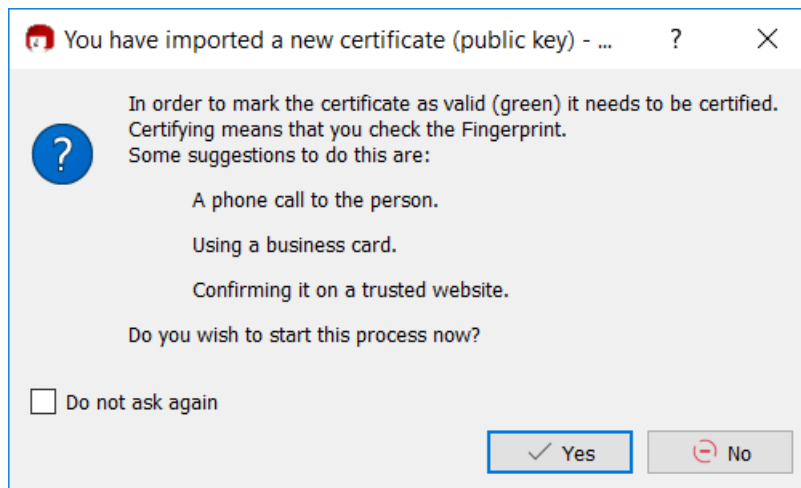

The installer packages above will provide all of these (except PuTTYtel), but you can download them one by one if you prefer.

(Not sure whether you want the 32-bit or the 64-bit version? Read the [FAQ entry](#).)

putty.exe (the SSH and Telnet client itself)

32-bit:	putty.exe	(or by FTP)	(signature)
64-bit:	putty.exe	(or by FTP)	(signature)

Importing the putty released key

Certifying the putty key

? ×

← Certify Certificate: PuTTY Releases

Step 1: Please select the user IDs you wish to certify.

☒ PuTTY Releases <putty@projects.tartarus.org>

Certificate: PuTTY Releases <putty@projects.tartarus.org> (B43434E4)
Fingerprint: 0054DDAA8ADA15D2768A6DE79DFE2648B43434E4

☒ I have verified the fingerprint

Next Cancel

Sending putty key to the server

? ×

← Certify Certificate: PuTTY Releases

Step 2: Choose how to certify.

Certification will be performed using certificate mohammed jahangir <mohammedjahangir@gmail.com>.

☐ Certify only for myself

☒ Certify for everyone to see

☒ Send certified certificate to server afterwards

Certify Cancel

Next click File → Decrypt/Verify Files → select putty.exe.gpg → click “file is a detached signature” → enter putty.exe as Signed Data

I was trying to do the above step but it did not work and I showed to lecturer Dylan about that.

I uninstall and re-install the application but its giving the same issue. I have attached the screenshot to verify that its not working for some reason.
